

Information for Conservation Areas

Delineation *not* Illumination!

The SolarEye®80 is a delineator designed specifically for cycle paths & pedestrian areas that has been developed with a unique omni-directional LED giving a 360° visibility.

During the marketing of this product we often heard people mentioning upwards light spillage and the effect it has on flying mammals – mainly Bats.

To provide a solution for areas with Bat colonies and other conservation sensitivities we have designed a version that we call, the 'Bat Hat'.

We have re-engineered the standard unit slightly and added an opaque lens to reduce the upwards light spillage by over 95% making it a friendlier option for Nocturnal Mammals/Insects.

Within Dark Sky areas, the SolarEye®80 is an excellent choice if your cycle path/walkway still needs to be visible without hindering star gazers.

This powerful delineator will not cause unwanted light fields – it will simply pave the way for the route you require.
